-1-ALTERNATIVE PRODUCTS: CELL LINES PRODUCING IGG CONTAIN TWO MRNA SPECIES FOR IG GAMMA CHAINS. THE MAJOR SPECIES BUCODES SECRETED GAMMA CHAINS. A LESS ABUNDANT SPECIES APPEARS TO ENCODE MEMBRANE-BOUND CHAINS IN THAT IT CONTAINS AN ALTERNATIVE 3' END, ENCODED IN SEPARATE EXONS, THAT IS HOWOLOGOUS WITH THE MEMBRANE-BOUND SEGMENT OF MU CHAINS.

ALTERNATIVE PRODUCTS: CELL LINES PRODUCING IGG CONTAÎN TWO MRNA SPECIES FOR IG GAMAA CHAINS. THE MAJOR SPECIES ENCODES SECRETED GAMAA CHAINS. A LESS ABUNDANT SPECIES APPEARS TO ENCODE MEMBRANE-BOUND CHAINS IN THAT IT CONTAINS AN ALTERNATIVE 3' END, ENCODED SEGMENT OF MU CHAINS. THAT IS HOMOLOGOUS WITH THE MEMBRANE-BOUND SEGMENT OF MU CHAINS.

MISCELLANEOUS: THE SEOURNCE OF RESIDUES 1-329 IS ASSUMED TO BE IDENTICAL WITH THE CORRESPONDING REGION OF THE SECRETED FORM OF

C;Complex: An immunoglobulin heterotetramer subunit consists of two identical light (hain disulfide bonds. In some cases, such as IgA and IgM, the subunits associate into C; Superfamily: immunoglobulin c region; immunoglobulin homology (S; Keywords: duplication; glycoprotein; heterotetramer; immunoglobulin F;20-85/Domain: immunoglobulin homology <IM3> F;27-85/Domain: immunoglobulin homology <IM3> F;24-310/Domain: immunoglobulin homology <IM3> F;27-310/Domain: immunoglobulin homology <IM3> F;27-83,144-204,250-308/Disulfide bonds: #status experimental F;109,112/Disulfide bonds: interchain (to light chain) #status experimental F;109,112/Disulfide bonds: interchain (co light chain) #status experimental F;109,112/Disulfide bonds: interchain (covalent) #status experimental
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                C: Species: Homo sapiens (man)

A;71tle: Interchain disulfide bridges of guinea pig gamma-2- immunoglobulin.
A;Reference number: A90354; MUID:71058474
A;Reference number: A90354; MUID:71058474
A;Rotents: annotation; disulfide bonds
A;Note: Cys-105, Cys-107, and Cys-110 form inter-heavy chain bonds
A;Note: Cys-105, Cys-107, and Cys-110 form inter-heavy chain bonds
C;Comment: This chain was isolated from pooled serum of strain 13 inbred guinea pigs.
C;Complex: An immunoglobulin heterotetramer subunit consists of two identical light (kap and igal) and igal, the subunits associate into la C;Superfamily: immunoglobulin C region; immunoglobulin homology
C;Keyvords: duplication; glycoprotein; heterotetramer; immunoglobulin

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                               The present sequence represents a fusion protein comprising of TNF alpha fused to the C-terminus of the heavy chain of the human monoclonal antibody 425 (hmb425). The hmb425 has specificity for the human EGF receptor. The invention claims for a new pMCLDHAP tricistronic vector (V18096) for the expression of an antibody-cytokine tusion protein, hmb425-TNF alpha. The TNF alpha sequence can be substituted by the IL-2 sequence. The vector also contains a strong promoter/enhancer unit, a selection marker gene and at least two poliovirus derived internal ribosomal entry site (IRES) sequences. The vector can be expressed in mammallan host cells for the production of heteromeric fusion proteins. This expression system is claimed to produce the heteromeric proteins in high yields.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  DGSFFLYSKLTVDKSRWQQGNVFSCSVMHEALHNHYTQKSLSLSPGKETFPPKYLHYDEE 241

This represents a recombinant metFc-OB protein variant which consists of an FC region of human immunoglobulin (19) fused to a human OB (obesity) protein. The invention provides a human OB protein suspension that contains at least 0.5 mg/ml of the human OB protein derivatised by attachment of the FC region of an Ig to the N-terminus of OB, and has a pH 6-8. The suspensions are used to reduce weight, adiposity and blood lipid levels, to treat or prevent diabetes type II, and to increase lean mass and insulin sensitivity. They may be used in conjunction with insulin, hypoglycaemics, antihypertensives, diuretics, appetite suppressants etc. These suspensions are stable and active at physiological pH and are ready-for-use formulations that do not require freezing or freezed drying. As they are very concentrated, only small volumes are required and they provide a sustained-release effect, with increased potency and reduced frequency of injection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     DGVEVHNAKTKPREEQYNSTYRVVSVLTVLHQDWLNGKEYKCKVSNKALPAPIEKTISKA 120

```
The present sequence represents a recombinant human MetFc-OB variant 2 fusion protein having a 5 residue deletion of residues 2-6 of the wild-type Fc-OB protein sequence shown in w49073. The invention provides Fc-OB fusion proteins whereby the Fc region of an immunoplobulin or its analogue is linked, either directly or indirectly using a linker, to the N-terminus of an OB protein or its analogue. The Fc-OB fusion proteins are claimed to demonstrate increased stability and clearance rate and decreased degradation as compared to OB protein or a fusion of Fc to the C-terminus of the OB protein. These Fc-OB fusion proteins are also claimed to be useful for treating excess weight in an individual or animal or for treating co-morbidities associated with excess fat such as diabetes, high blood lipid level, arterial sclerosis and stroke.

The invention relates to methods of delivering molecules to a mammal by administering a conjugative of a therapeutic or a bloactive substance, and an FCRN binding partner targeted to epithelial cells expressing FCRN. This can be used for modulating a mammalian immune system wherein, the bloactive substance is an antigen characteristic of a pathogen of an autoimmune disease, an allergen, or a tumour. The delivering method is used to deliver therapeutics, including chemotherapy agents, cytokines including interferon, hormones, including insulin and human growth hormone, fertility drugs, calcitonon, calcitriol and other bloactive steriols to intestinal, murosal and lung epithelium. The method is also used for transepithelial delivery of antigens to provoke tolerance and immunity. The method provides an immunisation that specifically targets the mucosal surfaces, and does not have the risks associated with injections, including needle transmission of AIDS or hepatitis, of prior art immunisation methods. The present sequence represents the amino acid sequence of an Fc fragment of human immunoglobulin 19G.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

This protein comprises a chimeric receptor consisting of an scrvengineered from anti-CD3 human antibody CTMO1 linked to an extracellular spacer comprising the human 1gG1 hinge. CH2 and CH3, linked to transmembrane and intracellular regions of the human T cell receptor zeta chain. It can be expressed in host cells (e.g. Jurkat) using a chimeric receptor gene (See T90512) constructed from DNA cassettes encoding ach receptor component. In a claimed encoding a chimeric receptor containing 2 or more different cytoplasmic signalling components. Also claimed is use of DNA encoding a recombinant chimeric receptor in a DNA delivery system. The DNA delivery systems can be used for the activation of cells to provide e.g. an increase in cell proliferation, expression of cytolytic activity, differentiation or other effector functions, antibody secretion. They can be used in the treatment of e.g. increased adhesion. They can be used in the treatment of e.g. increased adhesion. They can be used in the treatment of e.g. increased adhesion. They can be used in the treatment of e.g. infectious disease, inflammatory disease, cancer, allergic/atopic disease, transplants and metabolic/idiopathic disease, claimed).

                                                                                                                                                                                                                                                                                Tunnan T cell receptor zeta chain, iteaed to the intracellular region of human T cell receptor zeta chain, iteaed to the intracellular region of human CD28. It can be expressed in host cells (e.g. Jurkat) using a chimeric receptor gene (see T90513) constructed from DNA cassettes encoding aech component of the receptor. In a claimed cell activation process an effector cell is transformed with DNA cell activation process an effector cell is transformed with DNA encoding a chimeric receptor containing 2 or more different cytoplasmic signalling components. Also claimed is use of DNA encoding a recombinant chimeric receptor in a DNA delivery system. The DNA delivery systems can be used for the activation of cells to provide e.g. an increase in cell proliferation, expression of cytolytic activity, differentiation or other effector functions, antibody secretion, phagocytosis, tumour infiltration and/or increased adhesion. They can be used in the treatment of e.g. infectious disease, inflammatory disease, cancer, allergic/atopic disease, congenital disease, dermatologic disease, neurologic disease, transplants and metabolic/idiopathic disease, latinación, particular, they can be used in the treatment of rheumatoid arthritis, osteoarthritis, inflammatory bowel disease, asthma, eczema, cystic fibrosis, sickle cell anaemia, psoriasis, multiple scleensis, organ or tissue transplant rejection, graft-versus-host disease or diabetes (claimed).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        181
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             467
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   241

A NotI fragment containing the coding sequence of pSAB152 was used in the construction of expression vector pMDR(92)1g-3 which can be stably maintained in CHO cells to bind to CD2 and inhibit T cell activation, making it useful to treat acute and chronic inflammation, autoimmune disease and

agent inhibits CD2 signalling and T cell proliferation and activation and more particularly modulates the number and/or distribution of and more particularly modulates the number and/or distribution of memory effector T lymphocytes. The method can be used for treating a condition in a subject where the condition is characterized by memory effector T lymphocytes playing a role in the pathogenesis of the condition such as psoriatic arthritis, rheumatoid arthritis, multiple solerosis, atopic dermatitis, unclination and where the method comprises administering to the subject lymphoma and where the method comprises administering to the subject an amount of CD2 binding agent sufficient to modulate the memory effector T lymphocytes. The methods provide inhibition of antigen specific interactions for all antigens present, inhibition of T cell

activation, no general immunosuppression, and possibly induction of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This sequence is a fusion protein of the rabbit transforming growth factor-beta receptor II (TGF-betaRII) and an antibody Fc region. The encoded protein is an example of a protein of the invention, which are isolated TGF-beta receptor fusion proteins that competitively inhibit binding of TGF-beta to TGF-beta receptor. The fusion protein can be used in a method for lowering the levels of TGF-beta in an individual having arthritis. It can also be used to treat medical conditions such as fibroproliferative disorders. The fibroproliferative disorder is a

 erythematosus. They can also be administered following coronary angioplasty, to prevent restenosis or scarring and reclosing of arteries.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  factor-beta receptor II (TGF-betaRII) and an antibody Fc region. The encoded protein is an example of a protein of the invention, which are isolated TGF-beta receptor fusion proteins that competitively inhibit binding of TGF-beta to TGF-beta receptor. The fusion protein can be used in a method for lowering the levels of TGF-beta in an individual having arthritis. It can also be used to treat medical conditions such as fibroproliferative disorders. The fibroproliferative disorders is kidney, intraocular or pulmonary fibrosis, especially selected from

                                                      16-JUN-1998;
                                                                                 The present sequence represents a splice variant of a rabbit transforming growth factor-beta (TGF-beta) type II receptor fused to the Fc portion of human iggl. The fusion protein has higher affinity for TGF-beta than cusion proteins comprising the non-variant form of the receptor. The fusion protein contains soluble TGF-beta receptor constructs that are devoid of a transmembrane region (and are secreted from the cell) but retain the ability to bind TGF-beta. The protein competitively inhibits binding of TGF-beta to cellular receptors and/or forms an inactive complex with TGF-beta. The protein is used to reduce levels of TGF-beta, for treatment of arthritic conditions associated with overexpression of TGF-beta, especially fibroproliferative diseases, e.g. renal, intra-ocular or pulmonary fibrosis; diabetic nephropathy; myelofibrosis; collagen vascular disease, e.g. systemic lupus erythematosus; and collerant disease, e.g. systemic lupus erythematosus; and collerant overproduction of connective tissue and so prevent adhesions or scarring, and to prevent post-radiation fibrosis (by administration to patients about to undergo radiation therapy).

```
growth factor-beta (TGF-beta) type II receptor fused to the FC portion of human IgG1. The fusion protein has higher affinity for TGF-beta than fusion proteins comprising the non-variant form of the receptor. The fusion protein comprising the non-variant form of the receptor. The fusion protein contains soluble TGF-beta receptor constructs that are devoid of a transmembrane region (and are secreted from the cell) but retain the ability to bind TGF-beta. The protein competitively inhibits binding of TGF-beta coellular receptors and/or forms an inactive complex with TGF-beta. The protein is used to reduce levels of TGF-beta, for treatment of arthritic conditions associated with overexpression of TGF-beta, especially fibroproliferative diseases, e.g. renal, intra-ocular or pulmonary fibrosis; diabetic nephropathy; collagen vascular disease, e.g. systemic sclerosis, polymyositis, scleroderma, dermatomyositis or systemic lupus erythematosus; and fibrosis associated with reatmons of restenosis. It is also used for treating wounds, to prevent overproduction of connective tissue and so prevent adherenced to the connective tissue and so prevent addition and connective tissue and so prevent and connective tissue and

                                                                                                                                                                                                                                                                                                                                                                                                                                     interferon-beta (IRN-beta) especially IRN-beta-13, linker groups and non-IRN-beta proteins, especially an immunoglobulin (Ig) protein. The present sequence is a fusion protein that consists of mature human IRN-beta-1a and mouse IgG2a Fc domain separated by an enterokinase linker. The fusion protein is useful for inhibiting anglogenesis in a patient. It may also be used to treat multiple sclerosis, fibrosis, inflammatory and autoimmune diseases, cancers, hepatitis and viral infection characterised by

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    interferon-beta (IFN-beta) especially IFN-beta-1a, linker groups and non-IFN-beta proteins, especially an immunoglobulin (Ig) protein. The present sequence is a fusion protein consisting of a vascular cell adhesion molecule-1 (VCAM-1) signal sequence, a modified human IFN-beta-1a and human IgG1 Fc domain, which are directly fused without a linker sequence. The fusion protein is useful for inhibiting angiogenesis in a patient. It may also be used to treat multiple sclerosis, fibrosis, inflammatory and autoimmune diseases, cancers, hepatitis and viral infection characterised by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   /note= "Wild type IFN-beta-la Gly at position 162 is substituted by Cys"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          proteins comprising interferon-beta-la useful for inhibiting

                                     and
The patent discloses fusion proteins comprising glycosylated interferon-beta (IFN-beta) especially IFN-beta-la, linker groups and non-IFN-beta proteins, especially an immunoglobulin (Ig) protein. The present sequence is a fusion protein consisting of a vascular cell adhesion molecule-I (VCAM-I) signal sequence, a modified human IFN-beta-la which is linked to human IgG1 Fc domain via a G4S linker sequence. The fusion protein is useful for inhibiting anglogenesis in a patient. It may also be used to treat multiple sclerosis, fibrosis, inflammatory and autoimmune diseases, cancers, hepatitis and viral infection characterised by
